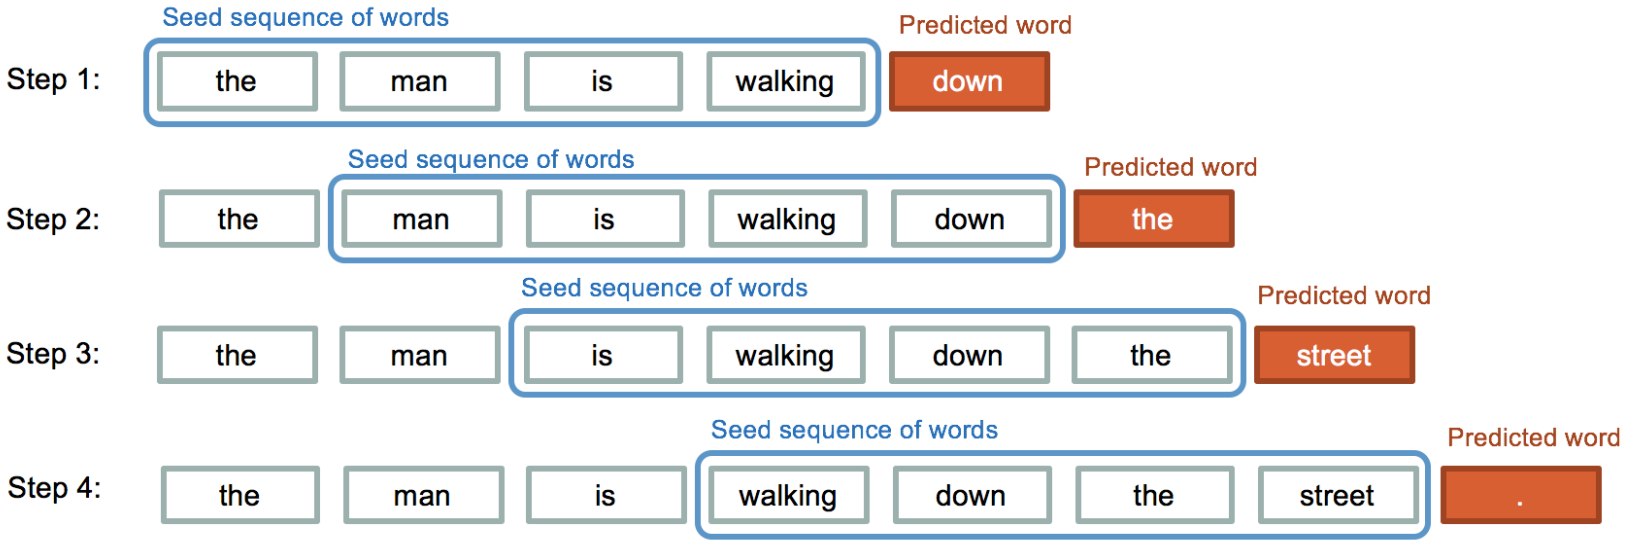
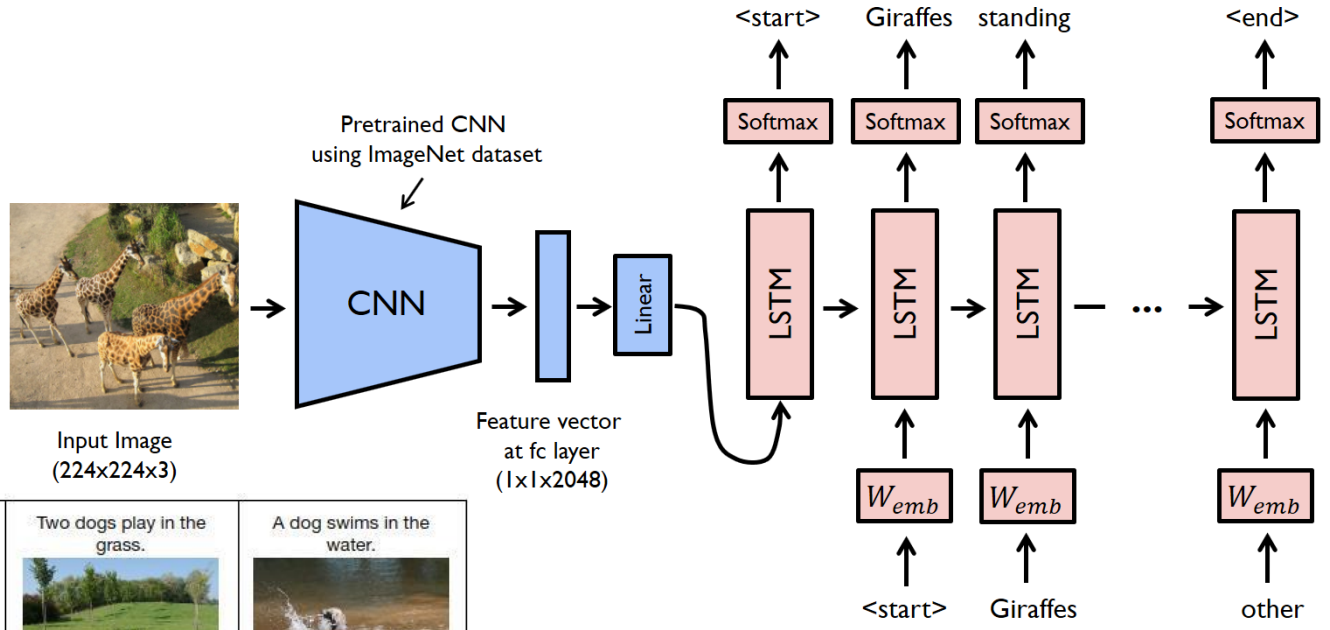
Textgenerierung mit RNN und LSTM



The **phrases** in **text** are nothing but **sequence** of **words**. So, LSTM can be used to **predict the next word**. The neural network take **sequence of words** as **input** and **output** will be a **matrix of probability** for **each word** from **dictionary** to be next of given sequence. The model will also learn how much **similarity** is between each words or characters and will calculate the probability of each.
Using that we will **predict** or **generate next word** or character of sequence.

Text Generation Using LSTM, 2020
bansalh944.medium.com/text-generation-using-lstm-b6ced8629b03

Kombinierter Einsatz von RNN und LSTM



RNN und **LSTM** können auch mit **Feed-Forward-Netze** (z.B. **Convolutional Neural Networks)** kombiniert werden. Sie bringen damit „**Memory**“ hinein.

Anwendungen sind z.B.:
Textuelle Beschreibung von Bildern (**Image Captioning**) oder Automatische Generierung von Untertiteln (**Video Captioning**).

Abstract

We present sketch-rnn, a recurrent neural network (RNN) able to construct stroke-based drawings of common objects. The model is trained on a dataset of human-drawn images representing many different classes. We outline a framework for conditional and unconditional sketch generation, and describe new robust training methods for generating coherent sketch drawings in a vector format.
